

USER MANUAL

Crypto Intelligence AI

How to get the most out of the predictions, futures signals, alerts, paper trading and demo bots — step by step.

Version 2.1.0 · November 2026

© 2026 Hesper. All rights reserved.

Use the app as a second opinion and a practice ground: let it find setups, check them yourself, test them with virtual money, and trust only what its own track record proves. It never places real orders.

Contents

1. Getting started
2. Membership plans and payment
3. Your first 10 minutes: setup checklist
4. Trade signals: long, short, buy or wait
5. A daily routine that gets the most out of it

11. Demo bots: proof of whether the predictions work
12. Results: track record, signal log and Accuracy
13. Tools: Scanner, Backtest and Replay
14. Rules for getting the most out of it
15. Troubleshooting

© 2026 Hesper

1. Getting started

The menu: Home · Signals · Trade · Results · News · Radar · **Tools** · Community · Alerts · Settings. **Tools** holds Scanner, Backtest and Replay (also under **Results → Tools**). **Results** holds the track record, the demo bots, the accuracy report and the signal log.

On phones the bottom bar has Home, Signals, Trade, Results and **More**. More is grouped: **Markets** (News, Radar), **Tools** (Scanner, Backtest, Replay) and **Account** (Alerts, Community, Settings), plus the **Beginner / Pro** view switch, **Contact support** and **Download Android app (APK)**. A dot on More, and a number next to **Alerts**, means you have unread alerts.

Beginner or Pro view: Beginner is simpler and hides the advanced numbers; Pro shows everything. Switch in the header, the More menu or **Settings → View mode**.

Open the app. Go to **www.cryptointelai.com** and press **Continue with Google**, or **Sign up with email** to use any email address.

Signing up with email:

1. Press **Sign up with email** (or **Sign in → Create account**), enter your email and a password of **at least 8 characters**, twice.
2. You'll see **Check your inbox**. Open the email we sent and tap the confirmation link (check the spam folder if it isn't there after a minute).
3. Come back to the app and press **I've confirmed my email**. Didn't get the email? Press **Resend email** (you can resend once a minute).
4. Next time, press **Sign in** and enter the same email and password. Forgot it? Press **Forgot password?**, enter your email, and follow the link we send you to choose a new one.

Your password goes only to the sign-in service (Google Firebase); the app never sees or stores it.

Choose a username. New accounts are offered a **username** after the first sign-in (press **Later** to skip; you only need one to post in Community, which asks for it): 3 to 20 characters, using letters a-z, numbers and _. It must be unique, some names are reserved (such as admin or support), and it **can't be changed later**. Other members see it next to your posts in Community; your email stays private.

Install it so it opens like a normal app and can send notifications:

1. **Android, as an APK:** tap **Download the Android app (APK)** in **Settings → Install the app** (or **More → Download Android app**). Open the file and allow "Install unknown apps" for your browser when Android asks. The app **needs Google Chrome** on the phone.
2. **Android or desktop, from Chrome:** open the site, then menu → **Install app** (or **Add to Home screen**).

3. **iPhone or iPad:** open the site in **Safari**, tap **Share → Add to Home Screen**, and always open it from that icon. On iOS, notifications only work this way.

Access. After signing in, new accounts see the membership screen: choose a plan, pay, and send the proof (section 2). The app opens by itself as soon as the owner approves your payment.

What you get. Every trade signal (futures and spot) on six timeframes, the track record, Accuracy and the demo bots, backtests and replays, your own practice accounts with auto-trade, alerts and phone notifications.

Need help? Email **support@cryptointelai.com**, or use **Contact support** (in **Settings → Help & support** or the **More** menu), which opens that email with your account details added for you.

2. Membership plans and payment

Access to the app is by membership. Choose the plan that suits you:

Plan	Price	Per month	You save
1 month	**15 USDT**	15.00 USDT	—
3 months	**40 USDT**	13.33 USDT	11%
6 months	**70 USDT**	11.67 USDT	22%
1 year	**130 USDT**	10.83 USDT	28%

The longer the plan, the lower the monthly price.

How to pay (about 2 minutes):

Pay in **USDT only**: both payment accounts (Binance and MEXC) accept USDT, so other coins such as USDC or BTC cannot be credited.

1. Sign in. On the membership screen, tap the plan you want.
2. Choose how to pay: **Binance** or **MEXC**.
   - **Binance:** open the **Binance app → Pay → Scan** and scan the QR code shown in the app (tap it to open it full size). Send the **exact amount** in USDT.
   - **MEXC:** open the **MEXC app → Wallets → Withdraw → USDT**, pick **Internal transfer (MEXC user)**, enter UID **00183657** (tap **Copy UID** in the app) and send the **exact amount**.
3. Take a screenshot of the **payment / transfer successful** screen, showing the amount and the order ID.

© 2026 Hesper

4. Back in the app, tap **Upload screenshot**, and paste the **order ID** (Binance → Pay → History, or MEXC → Wallets → History). Press **Send proof**.
5. The screen shows Payment proof sent · waiting for check. The owner checks the payment and approves it, and the app opens by itself.

If a proof is not accepted, you see the reason on the same screen and can send it again.

Renewing. Settings → Membership shows your plan, the date it ends and the days left. A banner appears in the last 7 days, and you get phone notifications 3 days and 1 day before the end. Tap **Renew / extend** and pay the same way. Renewing early never loses days: the new time is added after your current end date.

When a membership ends, the app locks until you renew. Your practice accounts, alerts and settings are kept and come back as soon as you renew; alerts pause while the membership is inactive.

> **Tip:** always use the order ID as well as the screenshot. It is the fastest way for the owner to find your payment.

3. Your first 10 minutes: setup checklist

Do these once and the app works for you in the background.

- ☐ **Install the app** on your phone (section 1).
- ☐ **Turn on notifications** (section 7): **Settings → Notifications → Turn on notifications**, then **Send a test notification**. It arrives within about 5 minutes.
- ☐ **Choose a look: Settings → Appearance**. Gold is the default; there are other themes and layouts, and a compact density for small screens.
- ☐ **Check your practice account:** open **Trade → Assets**. New accounts start with **$1,000** virtual USDT. Need more? Use **Add funds** (section 9).
- ☐ **Create one alert** for your favourite coin (section 7), so the app tells you when a setup appears.
- ☐ **Open Results → Track record** and see how the calls have really done (section 12).

© 2026 Hesper

4. Trade signals: long, short, buy or wait

Open **Signals** (bottom bar on phones). Pick **Futures** or **Spot** and a timeframe: **15M, 1H, 4H, 12H, 1D, 3D** or **All**. Then tap a coin.

Which calls you get:

Timeframe	Grades shown	Time limit
15M	A only	250 candles
1H	A only	200 candles
4H	A and B	100 candles
12H	A and B	30 candles
1D, 3D	A only	30 candles

If a call reaches neither the stop nor its last target within its time limit, the rest is closed at the market price.

All lists every coin and timeframe with a trade call in one list. Each row shows the coin, timeframe, grade, call, **Ready** (price is in the entry zone now) or **Wait for entry**, confidence, entry / stop / TP1 and the live result. Tap a row to open that coin on its timeframe. Tick **Show waits** to also see coins with no trade.

Filters and Sort: search a coin, filter by direction, grade and status (open / closed). **Sort:** Ready first (default), Strongest, Newest, Coin A–Z, and Timeframe (All only).

The card:

- **The call: GO LONG** / **GO SHORT** / **LONG ON PULLBACK** (futures), **BUY** / **BUY ON DIP** / **SELL / STAY OUT** (spot), or **WAIT** when there is no trade. Pullback / dip means: wait for a small dip to the entry. Spot calls are buy-only.
- **Entry:** the entry price and the entry zone. A line tells you whether the price is inside the zone now, or which price to wait for. Once a call is open, the card shows **Entry (recorded)**: the real price the track record uses.
- **Stop-loss** and **Take-profit 1 / 2 / 3**, each with the % move and, on futures, the ROI at the shown leverage.
- **Leverage (futures):**
  - **15M: 10–50x, chosen by the engine** from the stop distance. If the stop is too wide for 10x, there is no trade.
  - **Other timeframes:** a **suggested** leverage of **up to 10x**, with the liquidation price.

© 2026 Hesper

- **The price ladder** puts every level in order with the live price, so you see how far you are from the stop and the targets.
- **Grade: A · strong**: trend, AI models and their track record all agree. **B · moderate**: an AI-led call (only on 4H and 12H). Treat B as a smaller, more careful trade.
- **Why:** one line on what the call is based on.
- **AI confidence** (Pro view): **hit rate (similar calls)**, how often the AI was right before when it leaned the same way, on data it never trained on. 50% is a coin flip; 53–60% is a useful edge in crypto. Also the up / down chances and the funding rate.

Buttons: **Practise this trade** opens it in Trade with stop and target filled in, the bell sets an alert, **Copy** copies the plan as text. The **All coins** list shows every coin's call with entry, stop and TP1.

Radar: coins to watch. Every hour the engine screens all liquid Binance coins that are not in the app yet and ranks them by how strongly they outperform the market (against BTC over 7 and 30 days, trend, volume surge, breakouts). Coins that already went parabolic are shown apart with "wait for a pullback". Press **+ Add** to add a coin to your list. The Radar keeps its own record: every pick is scored 7 days later against BTC.

Reading the full coin page

Tap any coin to open its page. The chart has two modes: **AI chart** (the app's levels and trade plan drawn in) and **Pro chart** (TradingView, with its drawing tools and indicators). Below the trade call, read top to bottom:

1. **Decision: BUY, BUY ON PULLBACK, SELL or HOLD.** BUY ON PULLBACK means the direction is up but the price is stretched, so wait for the entry in the trade plan instead of chasing. HOLD means no edge worth trading. Most of the time HOLD is the right answer, and doing nothing is fine.
2. **Confidence / probability up.** The chance the models give that the price is higher at the end of the horizon. 50% is a coin flip. Around 55–60% is a real lean for crypto; anything that claims 80%+ should make you more careful, not less.
3. **Confident calls.** Results → Accuracy shows the confidence level above which the model has historically been right more often (the Confident calls card). Above it is a confident call, worth acting on; below it, treat the call as a lean only.
4. **Expected move / edge.** How big the move is expected to be. A 55% call with a tiny expected move is often not worth fees and slippage.
5. **Trade setup: entry, stop loss, targets.** The stop comes from recent volatility and support/resistance. **TP1 is always 1:1** (as far as the stop) and closes **half** the trade; then the stop moves to break-even. **TP2 (up to 1:2) and TP3 (up to 1:3)** are chosen by the AI and pulled in when support/resistance is in the way; a quarter closes at each. Tap **Trade plan** above the chart to draw it. "No valid setup" means a level is in the way or the odds are poor.

© 2026 Hesper

6. **Multi-timeframe card.** Each timeframe's view and an alignment score. The strongest setups are when timeframes agree. Signals are made on **15M, 1H and 4H** for quick trades and **12H, 1D and 3D** for swing trades; the weekly view is background trend only.
7. **Model consensus** (Pro view) **and "Why this signal?".** Each AI model votes; the explanation lists the reasons. Agreement between different models is a better sign than one model being very sure.

Rule of thumb: act only when the decision is a confident call, at least two timeframes agree, and you place the stop loss. Take half off at TP1 (1:1), then let the rest run to TP2 / TP3 with the stop at break-even.

5. A daily routine that gets the most out of it

About 10 minutes a day is enough. Prices update every few seconds and predictions refresh regularly, so you do not need to watch constantly.

When	Where	What to do
Morning (5 min)	**Signals**	See which coins have a GO LONG, GO SHORT or BUY call. Ignore WAIT.
Morning	**Coin page**	For each candidate, check timeframe agreement and the trade plan (section 4).
Morning	**Signals → Futures**	Check funding before going against the crowd (section 6).
When notified	**Alerts**	Open the alert, re-check the coin page, then practise the trade first.
Evening (3 min)	**Trade**	Review open positions; move stops only in your favour.
Weekly (10 min)	**Results** (Track record, Demo bots)	Compare models and bots over the last week and month. Keep what works.

Golden rule: a new strategy runs on the practice account for at least 2–4 weeks and 30+ trades before you even think about real money.

© 2026 Hesper

6. Futures: long, short and leverage

Signals → Futures shows every coin's futures call: **GO LONG**, **GO SHORT** or **WAIT**, with entry zone, stop-loss, take-profits, leverage, liquidation price, confidence and funding.

- **Leverage:** on **15M** the engine picks **10–50x**; on the other timeframes the card suggests **up to 10x**. In both cases the liquidation price stays well beyond the stop.
- **Funding 8h** (Pro view): positive funding means longs pay shorts every 8 hours. High positive funding plus a crowded long side often comes before a drop; the opposite before a squeeze up.

Futures rules that keep you alive:

1. Size the position from the stop and your risk (1–2% of the account per trade), never from the leverage.
2. Stay at or below the card's leverage. Higher leverage magnifies losses as much as gains.
3. Skip trades where funding is strongly against you, unless you will hold only a few hours.

7. Alerts and phone notifications

Alerts let the app watch the market for you. Open **Alerts → New alert**:

1. **Condition:** choose **Trade setup** (the most useful), or a price or indicator condition.
2. **Coin** and **Timeframe** (1H or 4H are the best balance of speed and accuracy).
3. **Direction:** long or short, long only, or short only.
4. **Market:** Spot, or Futures (adds suggested leverage and liquidation to the message).
5. **Minimum confidence** (optional, e.g. 55). Tick **Strong signals only (grade A)** for fewer, higher-quality alerts, or leave it off to also get grade B calls; **Confident calls only** narrows further.
6. **Cooldown:** minutes before the same alert can fire again (e.g. 240 for 4H).
7. Press **Create alert**.

When it fires, you get a notification with the side, entry, stop loss, take profit and confidence, and it is listed under **Fired alerts**. The engine checks every 5 minutes, so allow a few minutes of delay and check the price before entering.

The Alerts menu item shows a number when you have unread alerts.

Phone notifications

1. Open **Settings → Notifications** and tap **Turn on notifications**. Tap **Allow** when the phone asks. (The app may also ask by itself: **Allow notifications**.)

© 2026 Hesper

2. Tap **Send a test notification**. It arrives within about 5 minutes.
3. "This device" should say **on — also when the app is closed**.

Android: no notifications?

1. Make sure **Google Chrome** is installed and turned on (Play Store → Chrome). The Android app needs it.
2. Install the newest app: **More → Download Android app**.
3. Phone **Settings → Apps → Crypto AI → Notifications → Allow**.
4. Also allow notifications for **Chrome**, and turn battery saver off for the app.
5. In the app: **Settings → Notifications → Turn on**, then **Send a test notification**.

Closed the question by mistake? The app asks again (at most once a day), or tap **Turn on notifications** / **Try again**. If notifications are blocked, Settings shows **Still not working? Step by step**.

In Chrome (not the app): tap the lock icon next to the address → Notifications → Allow, then **Turn on** again.

iPhone: add the app to the Home Screen first (Safari → Share → Add to Home Screen, iOS 16.4+) and open it from that icon.

8. News and the economic calendar

US data releases (inflation/CPI, the jobs report, Fed interest-rate decisions) can move crypto several percent within minutes, in either direction. Open **News** to see:

- **The economic calendar** for this and next week in your local time, with the impact level, the forecast and the previous value, and one line on what each release usually means for crypto.
- **Crypto headlines** from CoinDesk, Cointelegraph and Decrypt, for context.

How the app protects you: from 45 minutes before a high-impact US release until 30 minutes after it, new trade signals are paused. A red **NEWS NOW** banner appears on the dashboard and the Signals page, and the trade cards show a warning. Members with notifications on get a heads-up 30 minutes before. Signals resume automatically after the release.

Tip: if you already hold a position before a big release, consider tightening the stop or taking partial profit; avoid opening new positions right before it.

© 2026 Hesper

9. Trade (paper trading): practise like on an exchange

Open **Trade** (bottom bar on phones). It works like Binance or MEXC, with virtual USDT; nothing touches a real exchange.

The screen:

- **Pair bar:** tap the coin to switch pairs; it shows the last price, 24h change and volume. Switch between **Futures** and **Spot** on the right. Prices and the chart update live on every trade; on the Futures tab they come from Binance Futures (the perpetual's own price, which differs slightly from spot), marked **live · futures price** under the price.
- **Gold (XAUT):** on the **Futures** tab, the coin list also has **XAUT** (Tether Gold, tagged GOLD), so you can follow and demo-trade gold with a live chart and order book. Binance offers gold only as a futures contract, so it is not on the Spot tab, and the AI does not make signals for it.
- **Gold signals (XAU/USD):** the Signals page includes **GOLD**. The AI trades it through PAXG (one token = one ounce of gold), which follows the XAU/USD price closely; the Pro chart shows forex.com's XAU/USD. If you trade gold on forex.com, use the same **% distances** from your entry that the signal shows for the stop and targets, because the two prices can differ slightly.
- **AI call strip:** the app's current call for this coin. **Use this plan** fills in the side, leverage, a limit at the entry price, the stop-loss and the take-profit for you.
- **Chart:** live candles (1m to 1D; signals are on 15M to 3D). Your entry, take-profit, stop-loss, liquidation price and open limit orders are drawn on it.
- **Order book** (computer): live bids and asks.
- **Order form: Limit** (buy or sell at your price; it fills when the market gets there) or **Market** (now). Set the size with the amount box or the **25 / 50 / 75 / 100%** buttons.

Futures: choose the **leverage** (1x–50x), tick **TP / SL** and enter both prices, then press **Buy / Long** or **Sell / Short**. The form shows the position size, the estimated liquidation price and the fee. **One-way / Hedge** switches whether you can hold a long and a short on the same coin at once. During the testing period you can have up to **5 open trades and orders** on futures, and hold up to **5 coins** on spot.

Spot: choose **Buy** or **Sell**, enter the total (USDT) or the amount of coins, and press the button.

Below the chart: Positions (live profit, ROE, liquidation; edit **TP / SL**, **Close 50%**, **Close all**), **Open orders** (cancel any time, the funds come back), **Order history**, and **Assets**. The newest position is always at the top.

Your practice money (Assets):

- New accounts start with **$1,000** virtual USDT.

© 2026 Hesper

- **Add funds:** tap **+$1,000**, **+$5,000** or type an amount and tap **Add**. It counts as a **deposit** (up to $1,000,000 in total).
- **P&L and Return** are measured against what you **deposited**, so adding money never looks like profit. Assets shows Equity, Deposited, P&L, Return, fees, win rate and more.
- **Reset account** starts a fresh **$1,000** account; positions, orders and deposits are cleared.

Position details: tap a position (or a spot holding) to open its details: pair, side, leverage, margin mode, size in coins and in USDT, entry and live price, unrealised profit in USDT and as ROI on margin, margin, liquidation price, take-profit and stop-loss, fees and funding paid, when it opened and how long it has been open, and where it came from (your own order, or **Auto-trade** from a signal, with links to that signal and to the Signal log). **Edit TP / SL**, **Close 50%** and **Close all** work there too. On a computer it opens at the side; on a phone it slides up from the bottom.

Switch the chart from a list: tap a **pair name** in Positions, Open orders or Order history and the chart switches to that coin, keeping the timeframe you chose. On a phone the page scrolls back up to the chart.

Stop-loss, take-profit, liquidation and limit orders are checked on every 15-minute candle, also while the app is closed. Fees: spot 0.1%, futures 0.05% market and 0.02% limit, plus funding every 8 hours.

How to practise properly: take only trades you would really take, at the real size; write down why you took each one and compare after 30 trades.

Auto-trade signals (Futures tab). Press **Turn on** and the app places its futures signals in your practice account by itself, also while the app is closed. Tap **Settings** to choose:

- **Margin per trade** (USDT).
- **Leverage:** Suggested by the signal (safest), or 1x–20x (capped so liquidation stays beyond the stop). **15M auto-trades always use the engine's 10–50x.**
- **Timeframes** (15M to 3D), **grade A only** or **A and B**, and **Take profit at** Target 1, 2 or 3.
- **Max open trades: up to 3**, and at most **6 new trades a day**.
- Max trades in the same direction, bigger size on stronger signals, all coins or only your own, and a notification for each trade.

Press **Save settings**. Inside the entry zone the trade opens at market; otherwise a limit order waits at the entry and is cancelled after 6 candles if it never fills. If a signal flips, only a trade from the **same timeframe** is closed and reversed; otherwise the new call is skipped. Auto-trades are marked **AUTO**; **Auto-trade activity** lists what was placed or skipped and why.

© 2026 Hesper

10. Community: talk with other members

Open **Community** (on phones under **More**). It is a shared wall where members post short messages, newest first.

- **Write a post:** type in the box at the top and press **Post**. Text only, up to **500 characters**; no pictures. Web addresses are shown as plain text (not clickable), so copy them if you want to open one. You can post once every **30 seconds**.
- **Your name:** the first time you post, Community asks you to choose a username. Posts show your **username** and how long ago they were posted. Posts by the app owner have an **ADMIN** badge.
- **Delete:** you can delete your own posts with **Delete** (posts cannot be edited). The owner can remove any post that breaks the rules.
- **Older posts:** the newest 20 are shown; press **Show older posts** for more.
- **Be kind:** no spam, no promotions and no sharing of personal details. Nothing posted in Community is financial advice, and other members can be wrong.

11. Demo bots: proof of whether the predictions work

Results → Demo bots runs automatic demo traders with virtual money around the clock, so you can see what following the app would really have earned.

- **Futures signal bots:** one per timeframe (15M, 1H, 4H, 12H, 1D, 3D). They take exactly the public calls on the Signals page, with the same entry, stop and targets: half closes at TP1 (1:1), a quarter at TP2 and a quarter at TP3. After TP1 the stop moves to break-even, after TP2 to TP1. Fees, funding and liquidation are included.
- **Size and exposure:** bots put a bit more on stronger calls and hold at most 3 trades in the same direction, because many coins moving together is really one bet.
- **Trade filter:** a second AI model checks each signal against which past setups really reached their targets. It is used only where it proved better on unseen data; filtered signals become WAIT.

Hesper Challenge (only when the owner turns it on): a separate **Results** tab showing a demo challenge with virtual money: start at $100, aim for $1,000, all-in on fresh grade-A calls. It is not a trading plan.

How to judge a bot:

1. Wait for **at least 30 closed trades**. Fewer than that is mostly luck.
2. Compare the **Bot equity** line with the dashed **Buy & hold** line. A bot that loses to simply holding adds no value.

© 2026 Hesper

3. Look at the **win rate**, **return** and **max drop** (could you live with that drop on real money?).
4. Compare timeframes; follow what wins over months, not days.

12. Results: track record, signal log and Accuracy

Results → Track record lists every published trade signal and its real result. How it counts:

- **Fresh start 3 Nov 2026:** the record counts from then.
- **Real entry price:** the market price when the call was published (pullback calls: once the price trades through their limit).
- **After fees:** every result includes trading costs (fees, slippage, spread) and the funding paid or received.
- **Win or loss is judged after fees:** a trade is a win only if it made money after fees.
- **Open trades are not in the win rate.** They show a **Live** price, move %, ROI, targets hit and the stop in force. Pullback calls show "waiting for entry".
- **ROI on margin** = result × the card's leverage (15M: 10–50x). Leverage magnifies losses.
- Wins and losses alike, never edited.

Tap a row for details: levels hit, time limit and time left, **Open chart** and **Practise this trade**. The **Tested on unseen data** tab (Pro view) shows how each coin's AI scored on past data it never saw; that is a simulation, not live results.

Results → Signal log lists every signal the engine logged. Filter by **coin**, **timeframe**, **side**, **grade**, **status** (Open, TP1, TP2, TP3 / Won, Stopped, Break-even, Expired, Not filled, Void, Not traded), **date** (24h, 7 days, 30 days, All, or your own dates) and **sort** (newest, oldest, best or worst result). **Clear all** resets. The filters stay in the page address, so you can share that exact view. On a phone, tap **Filters**.

Results → Accuracy is the app's honest report card. Every number on it is out-of-sample: measured on data the model had never seen, using walk-forward testing. Look at, in order:

1. **The verdict** for the coin and timeframe: does the model beat a naive guess, and is the p-value below 0.05 (edge unlikely to be luck)?
2. **Directional accuracy:** for crypto, **51–56% is realistic and useful**; nobody gets 70% consistently.
3. **Confident calls:** accuracy on the calls above the confidence threshold, usually a couple of points better.
4. **Calibration:** when the model says 60%, is it right about 60% of the time?
5. **Model comparison:** which model is best for this coin.

© 2026 Hesper

6. **Live predictions:** calls made in real time and scored after the outcome — the most honest check of all.
7. **Model drift:** "Drift detected" means the market changed and recent accuracy fell. Be more careful.

> **Practical rule:** trade a coin and timeframe only when its out-of-sample accuracy is above 52%, its confident calls are better still, and live predictions agree.

13. Tools: Scanner, Backtest and Replay

Backtest (**Tools**, or Results → Tools) runs a strategy over past data with fees and slippage. Choose the coin, timeframe, period and strategy under **Inputs** and run it. Read the verdict (Beats buy & hold or not), net return, win rate, profit factor, Sharpe and max drawdown. A strategy that only wins before costs does not win.

Replay (**Tools**) is the best way to build trust. Under **Choose a moment**, pick a coin and a past date and time. The app shows exactly what it knew and forecast then, without future data (the **Look-ahead audit** proves it). Decide what you would have done, then press **Reveal what happened next**. Do 10–20 replays across calm, rising and falling markets.

Scanner (**Tools**) shows all coins side by side; filter for tradable decisions, buy or sell signals.

14. Rules for getting the most out of it

1. **Let the app find setups; you make the decision.** A second opinion, not an autopilot.
2. **Prefer confident calls with timeframe agreement.** Fewer trades, better trades.
3. **Always use the stop loss** from the trade setup, and never move it further away.
4. **Risk 1–2% of your account per trade.** Size from the stop, not from leverage.
5. **Respect WAIT and NO TRADE.** Not trading is a position.
6. **Prove it on the practice account first:** 30+ trades and 2–4 weeks before risking real money.
7. **Check the bots and Accuracy weekly** and follow what the numbers say, not what you hope.
8. **Watch funding on futures;** avoid joining a crowded side.
9. **Be extra careful around big news:** models trained on normal markets can be wrong in sudden shocks.
10. **Expect losing streaks.** At 55% accuracy, five losses in a row will happen regularly.

15. Troubleshooting

Problem	Fix
"Payment proof sent · waiting for check"	The owner checks the payment and approves; the app opens by itself. Make sure the amount and order ID are visible. Waiting long? Use **Contact support**.
My proof was rejected	Read the reason on the membership screen, fix it (exact amount, right screenshot, order ID) and send again.
The app says my membership has ended	Renew on the same screen; your data is kept.
Header shows **RECONNECTING** instead of **LIVE**	It reconnects on its own within seconds. If it stays, check your internet, then reload.
"Insufficient data" or no forecast	Wait for the next engine run (about 5 minutes).
A 15M card says WAIT, "stop too wide"	The stop is too wide for the 10x minimum, so there is no trade. Respect WAIT.
The app looks old after an update	Close and reopen the app, or **Settings → About → Check for updates**. The version is shown at the bottom.
The home-screen icon did not change	Phones cache icons; remove and re-add the app, or reinstall the newest APK.
APK says "App not installed"	Uninstall the older copy first, then install the new APK.
No notifications	Follow the Android steps in section 7 (Chrome installed, newest app, allow in phone settings, test notification). On iPhone, open the app from the Home Screen icon.
A banner says the app needs Chrome	Install or turn on Google Chrome, then install the newest app (**More → Download Android app**).
A coin I added has no signals	During the testing period signals are made for the app's own coins (BTC, ETH, BNB, XRP, SOL, DOGE, LTC, AAVE, AVAX and gold).
Alerts arrive late	The engine runs every 5 minutes; a short delay is expected.
Futures order refused: "opposite position"	Switch to **Hedge** mode, or close the other side first.

Problem	Fix
The confirmation or password email didn't arrive	Wait a minute and check spam / promotions. Then use **Resend email** (once a minute) or **Forgot password?** again, and make sure the address is spelled right.
"Wrong email or password"	Check the address, or press **Forgot password?**. If you first signed up with Google, use **Continue with Google** instead.
"That username is taken"	Usernames are unique; add numbers or an underscore and try again.
My Community post won't send	Posts can be up to 500 characters, one every 30 seconds. Wait for the timer on the **Post** button, then try again.
Anything else	Use **Contact support** in Settings or the More menu, and describe what you see.

Important: the app is for analysis and practice. It is not financial advice, all trading in it uses virtual money, and past accuracy does not guarantee future results.
