

USER MANUAL

Crypto Intelligence AI

How to get the most out of the predictions, futures signals, alerts, paper trading and demo bots — step by step.

Version 2.0.0 · October 2026

© 2026 Hesper. All rights reserved.

Use the app as a second opinion and a practice ground: let it find setups, check them yourself, test them with virtual money, and trust only what its own track record proves. It never places real orders.

Contents

1. Getting started
2. Membership plans and payment
3. Your first 10 minutes: setup checklist
4. Trade signals: long, short, buy or wait
5. A daily routine that gets the most out of it
6. Futures: long, short and leverage
7. Alerts and phone notifications
8. News and the economic calendar
9. Trade (paper trading): practise like on an exchange
10. Demo bots: proof of whether the predictions work
11. When to trust the models: the Accuracy page
12. Backtest and Replay: test ideas on the past
13. Rules for getting the most out of it
14. Troubleshooting

© 2026 Hesper

1. Getting started

Open the app. Go to **crypapp-6a9b9.web.app** and press **Sign in with Google**.

Install it so it opens like a normal app and can send notifications:

1. **Android, as an APK:** open **Settings → Android app** and tap **Download APK**. Open the file and allow "Install unknown apps" for your browser when Android asks.
2. **Android or desktop, from Chrome:** open the site, then menu → **Install app** (or **Add to Home screen**).
3. **iPhone or iPad:** open the site in **Safari**, tap **Share → Add to Home Screen**, and always open it from that icon. On iOS, notifications only work this way.

Access. After signing in, new accounts see the membership screen: choose a plan, pay, and send the proof (section 2). The app opens by itself as soon as the owner approves your payment.

What you get. Every prediction and trade signal (spot and futures), Accuracy and the demo bots, backtests and replays, your own practice accounts, alerts and phone notifications, and up to 5 coins of your own.

Need help? Use **Contact support** (in **Settings → Help & support**, the **More** menu or the page footer) to email the app owner. Your account email is added for you.

2. Membership plans and payment

Access to the app is by membership. Choose the plan that suits you:

Plan	Price	Per month	You save
1 month	**$15**	$15.00	—
3 months	**$40**	$13.33	11%
6 months	**$70**	$11.67	22%
1 year	**$130**	$10.83	28%

The longer the plan, the lower the monthly price.

How to pay (about 2 minutes):

1. Sign in. On the membership screen, tap the plan you want.

© 2026 Hesper

2. Open the **Binance app → Pay → Scan** and scan the QR code shown in the app (tap it to open it full size). Send the **exact amount** in USDT.
3. Take a screenshot of the Binance **payment successful** screen, showing the amount and the order ID.
4. Back in the app, tap **Upload screenshot**, and paste the **Binance order ID** (Binance → Pay → History → the payment). Press **Send proof**.
5. The screen shows Payment proof sent · waiting for check. The owner checks the payment in Binance and approves it, and the app opens by itself.

If a proof is not accepted, you see the reason on the same screen and can send it again.

Renewing. Settings → Membership shows your plan, the date it ends and the days left. A banner appears in the last 7 days, and you get phone notifications 3 days and 1 day before the end. Tap **Renew / extend** and pay the same way. Renewing early never loses days: the new time is added after your current end date.

When a membership ends, the app locks until you renew. Your practice accounts, alerts and settings are kept and come back as soon as you renew; alerts pause while the membership is inactive.

> **Tip:** always use the order ID as well as the screenshot. It is the fastest way for the owner to find your payment.

3. Your first 10 minutes: setup checklist

Do these once and the app works for you in the background.

- [ ] **Install the app** on your phone (section 1).
- [ ] **Add your own coins:** the **My coins** card on the Dashboard shows the shared coins plus your own. Tap **+ Add coin**, search any coin listed on Binance (e.g. PEPE, SOL, TON) and add up to **5 coins of your own**. Each gets a live price straight away, and signals, AI forecasts, alerts and practice trading within about 15–30 minutes. Remove one with ✕ in edit mode. The button shows how many you can still add.
- [ ] **Turn on notifications: Settings → Notifications → Turn on notifications**, then press **Send a test notification**. The test comes on the engine's next run (within about 10 minutes).
- [ ] **Choose a look: Settings → Appearance**. Gold is the default; there are other themes and layouts, and a compact density for small screens.

© 2026 Hesper

- [ ] **Set up your practice account:** open **Trade → Assets**, type a **Starting balance** close to what you would really trade (e.g. 1,000 USDT) and press **Reset account**.
- [ ] **Create one alert** for your favourite coin (section 7), so the app tells you when a setup appears.
- [ ] **Open Accuracy** and note today's hit rates. This is your baseline for deciding how much to trust the models (section 11).

4. Trade signals: long, short, buy or wait

Open **Signals** (bottom bar on phones). Pick **Futures** or **Spot** and a timeframe (1H and 4H are the most useful), then tap a coin. You get one clear card:

- **The call: GO LONG** / **GO SHORT** (futures), **BUY** / **SELL / STAY OUT** (spot), or **WAIT** when there is no trade. On pullback means: wait for a small dip to the entry before buying.
- **Entry:** the ideal price and the entry zone. A line under the call tells you whether the price is inside the zone right now, or which price to wait for.
- **Stop-loss** and **Take-profit 1 / 2 / 3**, each with the % distance; futures also show the **suggested leverage** and the **liquidation price**.
- **The price ladder** puts every level in order, with the live price slotted in, so you see at a glance how far you are from the stop and the targets.
- **Grade:** every trade call carries a strength badge. **A · strong** means the trend, the AI models and the models' own track record all agree. **B · moderate** is an AI-led call: the trend is unclear, but the AI's lean is bigger than the threshold at which it has been right more often than not on past data it never trained on. Grade A is the safer pick; treat B as a smaller, more careful trade.
- **Why:** one line saying what the call is based on.
- **Hit rate (similar calls):** how often the AI was right in the past when it leaned the same way by a similar amount, measured on data it was not trained on. 50% is a coin flip; 53–60% is a real, useful edge in crypto. The **up / down** chances behind the call sit next to it.

Buttons: **Practise this trade** opens it in the trading screen with stop and target filled in, the bell sets an alert, **Copy** copies the plan as text. The **All coins** list shows every coin's call with entry, stop and first target. The same card appears at the top of each coin's page and on the **Futures** page.

© 2026 Hesper

Radar: coins to watch. Every hour the engine screens all liquid Binance coins that are not in the app yet and ranks them by how strongly they outperform the market (against BTC over 7 and 30 days, trend, volume surge, breakouts). Coins that already went parabolic are shown apart with "wait for a pullback". Press **+ Add** to follow a coin; its AI long/short calls start once its model is trained. The Radar keeps its own record: every pick is scored 7 days later against BTC.

Reading the full coin page

Tap any coin to open its page. The chart has two modes: **AI chart** (the app's levels, trade plan and structure drawn in) and **Pro chart** (TradingView, with its full drawing tools and indicators). Below the trade call, read it top to bottom in this order:

1. **Decision: BUY, BUY ON PULLBACK, SELL or HOLD.** BUY ON PULLBACK means the direction is up but the price is stretched, so wait for the entry in the trade plan instead of chasing. HOLD means no edge worth trading. Most of the time HOLD is the right answer, and doing nothing is fine.
2. **Confidence / probability up.** The chance the models give that the price is higher at the end of the horizon. 50% is a coin flip. Around 55–60% is a real lean for crypto; anything that claims 80%+ should make you more careful, not less.
3. **Confident calls.** The Accuracy page shows the confidence level above which the model has historically been right more often (the Confident calls card). Above it is a confident call, worth acting on; below it, treat the call as a lean only.
4. **Expected move / edge.** How big the move is expected to be. A 55% call with a tiny expected move is often not worth fees and slippage.
5. **Trade setup: entry, stop loss, targets.** Built from recent volatility (ATR) and support/resistance; tap **Trade plan** above the chart to draw it. Always use the stop loss. "No valid setup" means the reward is too small for the risk.
6. **Multi-timeframe card.** Shows each timeframe's view and an alignment score. The strongest setups are when timeframes agree. The 1H and 4H models have the better track record; give the daily call less weight.
7. **Model consensus and "Why this signal?".** Each model (gradient boosting, LSTM, GRU, Transformer) votes, and the explanation card lists the reasons. Agreement between very different models is a better sign than one model being very sure.

> **Rule of thumb:** act only when the decision is a confident call, at least two timeframes agree, and the reward to the take profit is at least 1.5× the risk to the stop loss.

© 2026 Hesper

5. A daily routine that gets the most out of it

About 10 minutes a day is enough. Prices update every few seconds and predictions refresh regularly, so you do not need to watch constantly.

When	Where	What to do
Morning (5 min)	**Signals**	See which coins have a GO LONG, GO SHORT or BUY call. Ignore WAIT.
Morning	**Coin page**	For each candidate, check timeframe agreement and the trade plan (section 4).
Morning	**Futures**	Check funding before going against the crowd (section 6).
When notified	**Alerts**	Open the alert, re-check the coin page, then practise the trade first.
Evening (3 min)	**Trade**	Review open positions; move stops only in your favour.
Weekly (10 min)	**Accuracy**, **Bots**	Compare models and bots over the last week and month. Keep what works.

Golden rule: a new strategy runs on the practice account for at least 2–4 weeks and 30+ trades before you even think about real money.

6. Futures: long, short and leverage

The **Futures** page shows every coin's futures call as a clear trade card: **GO LONG**, **GO SHORT** or **WAIT**, with the entry zone, stop-loss, take-profits, suggested leverage, liquidation price, confidence and funding. Use the filter buttons to show only trade calls, longs or shorts, and tap **Practise this trade** to open the setup in the trading screen.

- **Suggested leverage and liquidation price:** the liquidation price must always be further away than your stop.
- **Funding 8h:** positive funding means longs pay shorts every 8 hours. High positive funding plus a crowded long side often comes before a drop; the opposite before a squeeze up.

Leverage & liquidation calculator (bottom of the page). Enter entry, stop, leverage, balance and risk per trade. It gives the position size, margin, loss at the stop and the **max safe leverage**. If it says liquidation BEFORE your stop, lower the leverage.

© 2026 Hesper

Futures rules that keep you alive:

1. Size the position from the stop and your risk (1–2% of the account per trade), never from the leverage.
2. Stay at or below the suggested leverage; 2–5× is plenty for crypto.
3. Skip trades where funding is strongly against you, unless you will hold only a few hours.

7. Alerts and phone notifications

Alerts let the app watch the market for you. Open **Alerts → New alert**:

1. **Condition:** choose **Trade setup** (the most useful), or a price or indicator condition.
2. **Coin** and **Timeframe** (1H or 4H are the best balance of speed and accuracy).
3. **Direction:** long or short, long only, or short only.
4. **Market:** Spot, or Futures (adds suggested leverage and liquidation to the message).
5. **Minimum confidence** (optional, e.g. 55). Tick **Strong signals only (grade A)** for fewer, higher-quality alerts, or leave it off to also get grade B calls; **Confident calls only** narrows further.
6. **Cooldown:** minutes before the same alert can fire again (e.g. 240 for 4H).
7. Press **Create alert**.

When it fires, you get a notification with the side, entry, stop loss, take profit and confidence, and it is listed under **Fired alerts**. The engine checks about every 5–10 minutes, so allow a few minutes of delay and check the price before entering.

Notifications on your phone: Settings → Notifications → Turn on notifications, allow them when asked, then **Send a test notification**. On iPhone, open the app from the Home Screen icon first.

8. News and the economic calendar

US data releases (inflation/CPI, the jobs report, Fed interest-rate decisions) can move crypto several percent within minutes, in either direction. Open **News** to see:

- **The economic calendar** for this and next week in your local time, with the impact level, the forecast and the previous value, and one line on what each release usually means for crypto.
- **Crypto headlines** from CoinDesk, Cointelegraph and Decrypt, for context.

© 2026 Hesper

How the app protects you: from 45 minutes before a high-impact US release until 30 minutes after it, new trade signals are paused. A red **NEWS NOW** banner appears on the dashboard and the Signals page, and the trade cards show a warning. Members with notifications on get a heads-up 30 minutes before. Signals resume automatically after the release.

Tip: if you already hold a position before a big release, consider tightening the stop or taking partial profit; avoid opening new positions right before it.

9. Trade (paper trading): practise like on an exchange

Open **Trade** (bottom bar on phones). It works like Binance or MEXC, with virtual USDT; nothing touches a real exchange.

The screen:

- **Pair bar:** tap the coin to switch pairs; it shows the last price, 24h change and volume. Switch between **Futures** and **Spot** on the right. Prices and the chart update live on every trade; on the Futures tab they come from Binance Futures (the perpetual's own price, which differs slightly from spot), marked **live · futures price** under the price.
- **AI call strip:** the app's current call for this coin. **Use this plan** fills in the side, leverage, a limit at the entry price, the stop-loss and the take-profit for you.
- **Chart:** live candles (1m to 1D). Your entry, take-profit, stop-loss, liquidation price and open limit orders are drawn on it.
- **Order book** (computer): live bids and asks.
- **Order form: Limit** (buy or sell at your price; it fills when the market gets there) or **Market** (now). Set the size with the amount box or the **25 / 50 / 75 / 100%** buttons.

Futures: choose the **leverage** (1x–50x), tick **TP / SL** and enter both prices, then press **Buy / Long** or **Sell / Short**. The form shows the position size, the estimated liquidation price and the fee. **One-way / Hedge** switches whether you can hold a long and a short on the same coin at once.

Spot: choose **Buy** or **Sell**, enter the total (USDT) or the amount of coins, and press the button.

Below the chart: Positions (live profit, ROE, liquidation; edit **TP / SL**, **Close 50%**, **Close all**), **Open orders** (cancel any time, the funds come back), **Order history**, and **Assets** (equity, return, fees, win rate, and **Reset account** with your own starting balance).

Stop-loss, take-profit, liquidation and limit orders are checked on every 15-minute candle, also while the app is closed. Fees: spot 0.1%, futures 0.05% market and 0.02% limit, plus funding every 8 hours.

© 2026 Hesper

How to practise properly: take only trades you would really take, at the real size; write down why you took each one and compare after 30 trades; reset the account only when you change strategy.

Auto-trade signals (Futures tab). Press **Turn on** and the app places its futures signals in your practice account by itself, also while the app is closed. In **Settings** choose the **margin per trade** (USDT), the leverage (the signal's suggested leverage is the safest; any higher choice is capped so liquidation stays beyond the stop), the timeframes, grade A only or A+B, which target to take profit at, the maximum number of open trades, the maximum in the same direction (default 3), whether stronger signals get a bigger size, and all coins or only your own. Inside the entry zone the trade opens at market; otherwise a limit order waits at the ideal entry and is cancelled after 6 candles if it never fills. Auto-trades are marked **AUTO** and you get a notification for each. It is the easiest way to see what following every signal would really do to an account.

10. Demo bots: proof of whether the predictions work

The **Bots** page runs automatic demo traders with virtual money around the clock, so you can see what following the app would really have earned.

- **Signal bots** trade only the final decisions (BUY, BUY ON PULLBACK, SELL) using the trade plan's entry, stop and three targets, taking a third off at each target. After take-profit 2 the stop moves up to take-profit 1 (a trailing stop), so the last third can run without giving back the gains. The two **App scorecard** bots (futures, grades A+B, 1H and 4H) take exactly the calls members see on the Signals page, on every coin, so their result is the app's real performance; they are shown first on the Track record. The standard bots trade grade A calls only; the **A+B** bots also take grade B calls, so you can compare quality against quantity.
- **Prediction trackers** take every raw model call for one bar, showing how good the raw predictions are.
- **Futures bots** trade the same calls as perpetual futures with leverage, liquidation and funding.

Trade filter, sizing and exposure (v2.0): a second AI model checks every signal against the model's own history of which setups actually reached their targets before the stop (with the bots' exact exit rules and costs). It is switched on per coin only where it proved better on unseen data, and filtered signals become WAIT. Bots and auto-trades put a bit more on stronger calls (grade A 1.2x, grade B 0.8x, up to 1.5x when the filter rates the setup highly) and hold at most 3 trades in the same direction, because many coins moving together is really one bet on the market.

Futures data in the AI (v2.0): the models can also use futures-market positioning (funding rates and the perpetual premium, hourly). For every coin and timeframe the engine tests this on past data the model never saw, and only switches it on where it measurably improves accuracy. Where it doesn't help, the model keeps working without it.

© 2026 Hesper

How to judge a bot:

1. Wait for **at least 30 closed trades**. Fewer than that is mostly luck.
2. Compare the **Bot equity** line with the dashed **Buy & hold** line. A bot that loses to simply holding adds no value.
3. Look at the **win rate after costs**, **profit factor** (above 1.2 is good) and **max drawdown** (could you live with that drop on real money?).
4. Compare spot vs futures and confident-only vs all calls; follow the style that wins over months, not days.

11. When to trust the models: the Accuracy page

Track record (menu) lists every trade signal since launch with its real result (target hit, stopped or expired), the win rate and the running total, plus how each coin's AI scored on past data it never saw. Nothing is removed. The start page shows visitors the **Wins of the day**: real winning signals from the last 24 hours.

Weekly report (menu) turns each week into a ready-to-post image (square post or 9:16 story) with the week's best signals, the full totals (wins and losses) and the app link, plus a caption to copy. A new report is ready every Monday.

Achievements (menu) shows the milestones the app has really reached (signals delivered, best signal, winning streaks, profitable weeks, the scorecard bot beating buy & hold, Radar star picks), worked out from the real track record. Download any badge as an image, or all of them as one poster.

The **Accuracy** page is the app's honest report card. Every number on it is out-of-sample: measured on data the model had never seen, using walk-forward testing. Look at, in order:

1. **The verdict** for the coin and timeframe: does the model beat a naive guess, and is the p-value below 0.05 (edge unlikely to be luck)?
2. **Directional accuracy:** for crypto, **51–56% is realistic and useful**; nobody gets 70% consistently.
3. **Confident calls:** accuracy on the calls above the confidence threshold, usually a couple of points better.
4. **Calibration:** when the model says 60%, is it right about 60% of the time?
5. **Model comparison:** which model is best for this coin.
6. **Live predictions:** calls made in real time and scored after the outcome — the most honest check of all.
7. **Model drift:** "Drift detected" means the market changed and recent accuracy fell. Be more careful.

© 2026 Hesper

Practical rule: trade a coin and timeframe only when its out-of-sample accuracy is above 52%, its confident calls are better still, and live predictions agree.

12. Backtest and Replay: test ideas on the past

Backtest runs a strategy over past data with fees and slippage. Choose the coin, timeframe, period and strategy under **Inputs** and run it. Read the verdict (Beats buy & hold or not), net return, win rate, profit factor, Sharpe and max drawdown. A strategy that only wins before costs does not win.

Replay is the best way to build trust. Under **Choose a moment**, pick a coin and a past date and time. The app shows exactly what it knew and forecast then, without future data (the **Look-ahead audit** proves it). Decide what you would have done, then press **Reveal what happened next**. Do 10–20 replays across calm, rising and falling markets.

13. Rules for getting the most out of it

1. **Let the app find setups; you make the decision.** A second opinion, not an autopilot.
2. **Prefer confident calls with timeframe agreement.** Fewer trades, better trades.
3. **Always use the stop loss** from the trade setup, and never move it further away.
4. **Risk 1–2% of your account per trade.** Size from the stop, not from leverage.
5. **Respect WAIT and NO TRADE.** Not trading is a position.
6. **Prove it on the practice account first:** 30+ trades and 2–4 weeks before risking real money.
7. **Check the bots and Accuracy weekly** and follow what the numbers say, not what you hope.
8. **Watch funding on futures;** avoid joining a crowded side.
9. **Be extra careful around big news:** models trained on normal markets can be wrong in sudden shocks.
10. **Expect losing streaks.** At 55% accuracy, five losses in a row will happen regularly.

14. Troubleshooting

Problem	Fix
"Payment proof sent · waiting for check"	The owner checks Binance and approves; the app opens by itself. Make sure the amount and order ID are visible. Waiting long? Use **Contact support**.

© 2026 Hesper

Problem	Fix
My proof was rejected	Read the reason on the membership screen, fix it (exact amount, right screenshot, order ID) and send again.
The app says my membership has ended	Renew on the same screen; your data is kept.
Header shows **RECONNECTING** instead of **LIVE**	It reconnects on its own within seconds. If it stays, check your internet, then reload.
"Insufficient data" or no forecast	New coins need the next engine run (about 10 minutes) and enough history.
The app looks old after an update	Close and reopen the app, or **Settings → About → Check for updates**. The version is shown at the bottom.
The home-screen icon did not change	Phones cache icons; remove and re-add the app, or reinstall the newest APK.
APK says "App not installed"	Uninstall the older copy first, then install the new APK.
No notifications when the app is closed	Allow notifications for the app in phone settings and make sure battery saver is not blocking it. On iPhone, open the app from the Home Screen icon.
Alerts arrive late	The engine runs about every 5–10 minutes; a short delay is expected.
Futures order refused: "opposite position"	Switch to **Hedge** mode, or close the other side first.
Anything else	Use **Contact support** in Settings, the More menu or the footer, and describe what you see.

Important: the app is for analysis and practice. It is not financial advice, all trading in it uses virtual money, and past accuracy does not guarantee future results.

© 2026 Hesper
